

User Interface Suggestion

1. Knowledge Map List

- When the name description of a knowledge map is too long, the buttons wrap as following figure shows. It would be better to fix the width of the Name and Description columns, so the buttons will never be wrapped to a new line.

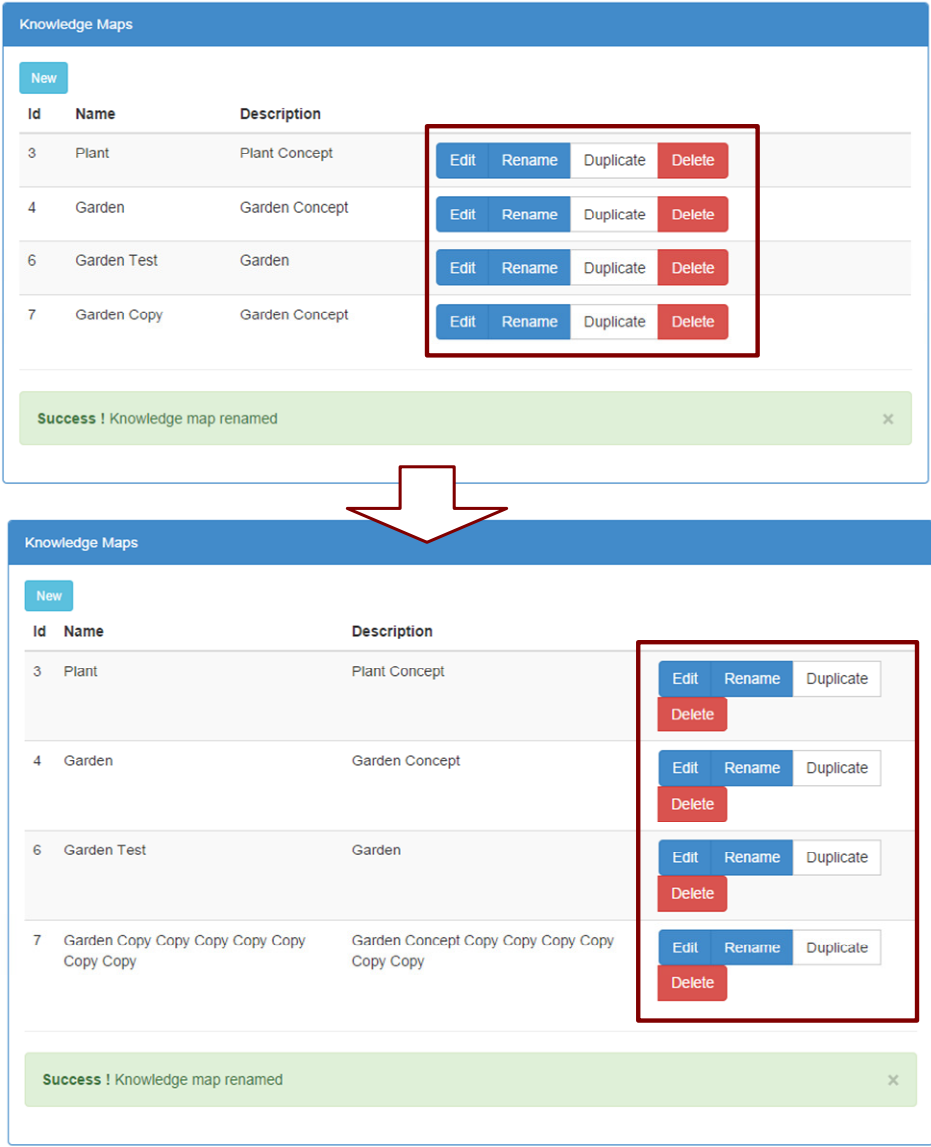

Figure 1. Knowledge Map functions (i.e., buttons) wrap when any knowledge map has long name or description.

2. Nodes in Concept Hierarchy

- When the node's name in Concept Hierarchy is too long, the text wrap. It would be better to use indent or bullet instead of space.

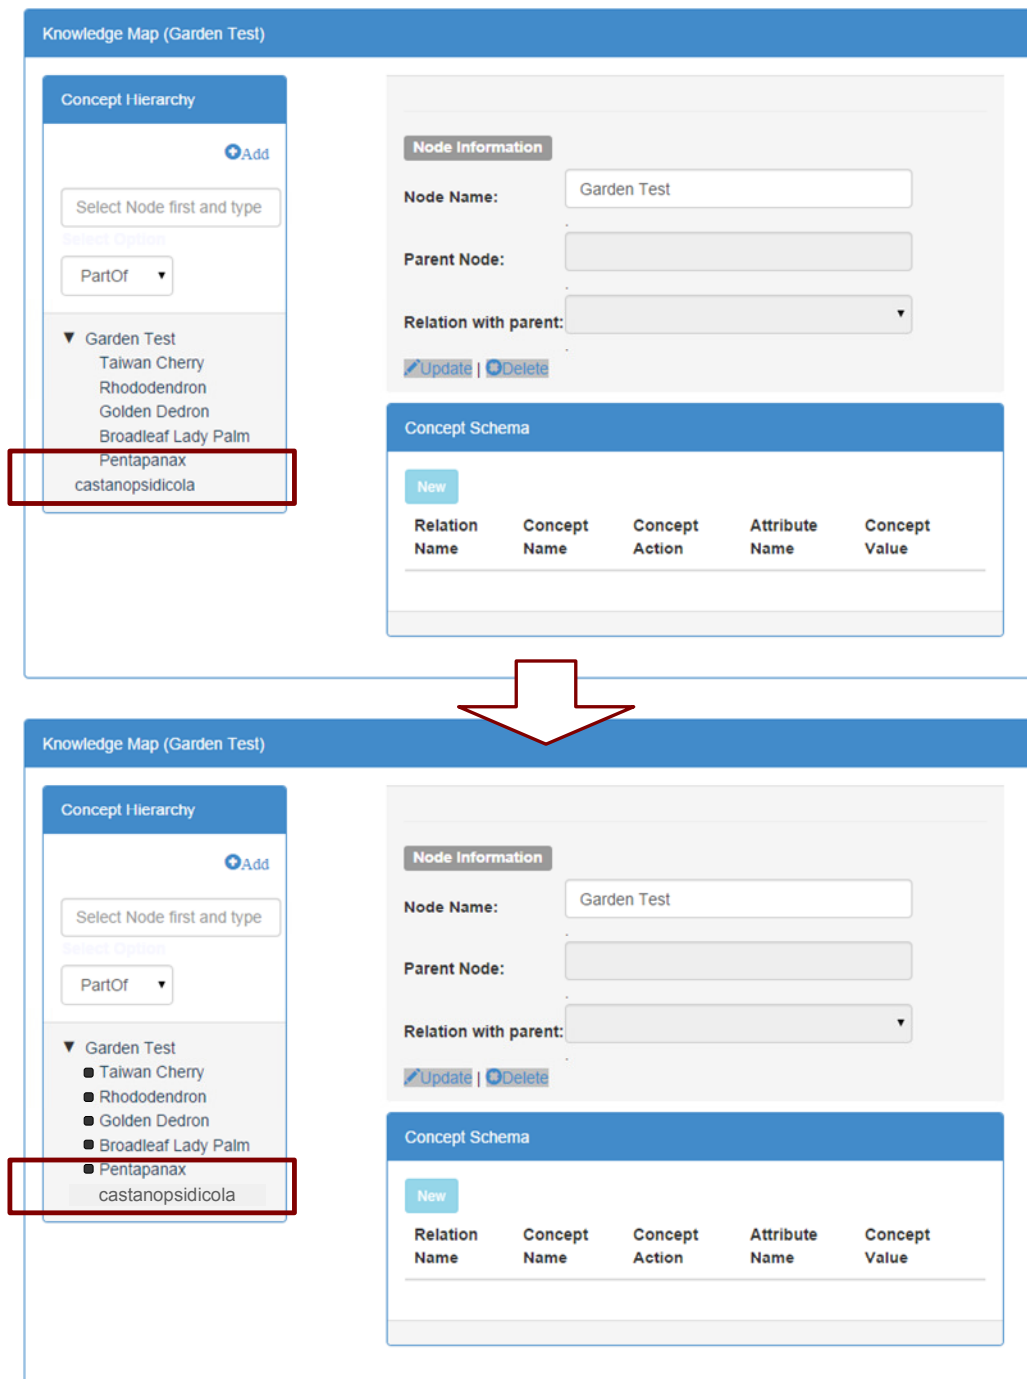

Figure 2. Upper Function Bar after signed-in

Unsmooth procedure

1. An Error Occurred in Editing Nodes in Concept Hierarchy

The process shows as following steps:

- First, I select a concept node.

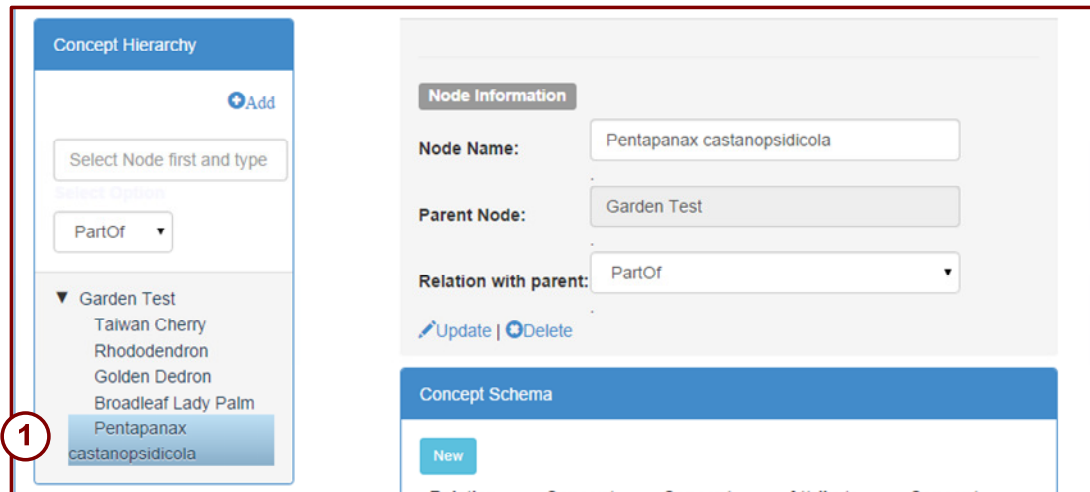

Figure 3. Select one node in Concept Hierarchy.

- Next, I change the concept name and click "Update" link.

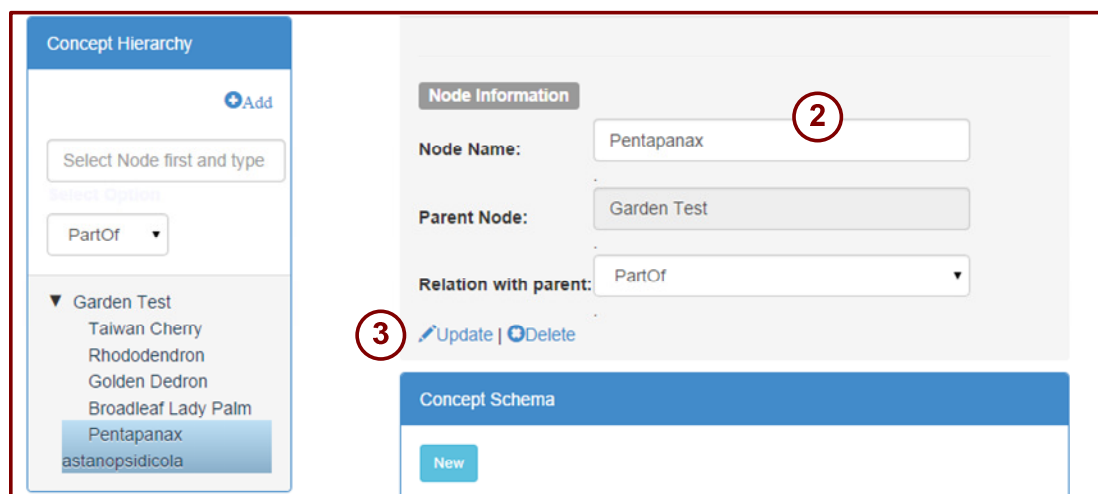

Figure 4. Update node information of the selected node.

- After node's name updated, the original selected concept node is not selected in Concept Hierarchy, but the "Node Information" frame still shows the information of the original selected node.

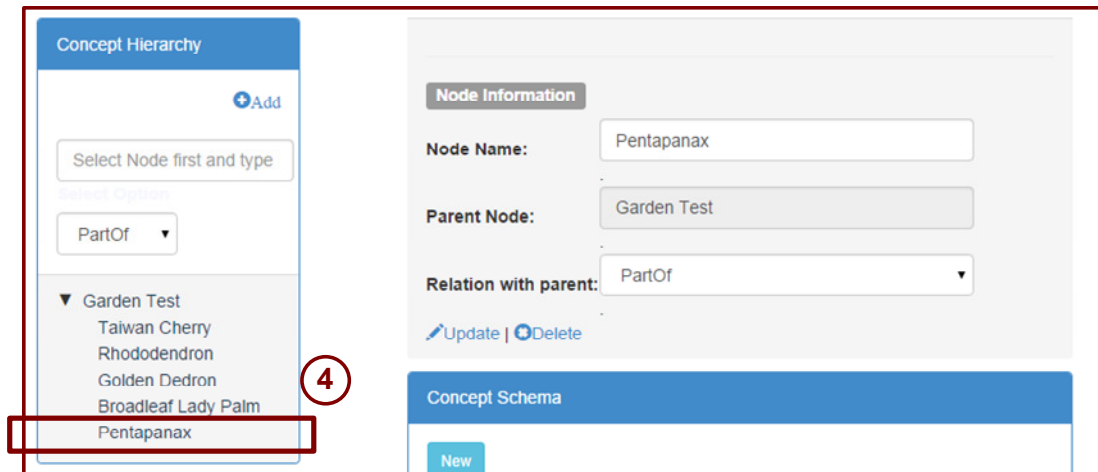

Figure 5. The original selected node is not selected.

- Users might believe the original selected node is still selected. When they do the second update (step 5 and step 6 in Figure 6), the error shows (step 7 in Figure 6).

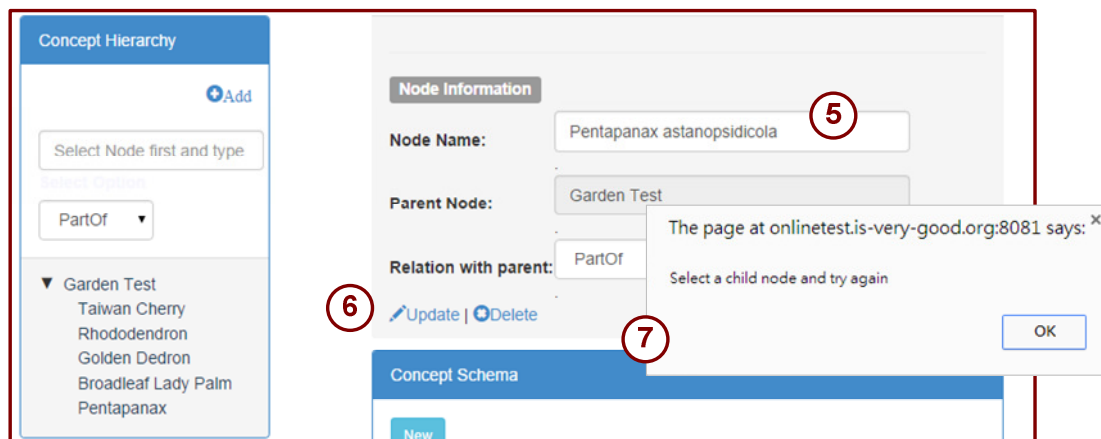

Figure 6. Error occurred when update the un-selected node.
